

WordWriter Introduction

What is WordWriter?

WordWriter is a high performance .NET assembly that creates Microsoft Word documents on a Web server. A few simple lines of code generate editable presentation-quality documents that can be saved or viewed instantly by thousands of concurrent users.

The documents generated by WordWriter are in Microsoft Word format (.doc, .dot) or Office Open XML format (.docx, .docm, .dotx, .dotm) and preserve all of the familiar features associated with Word documents. WordWriter offers high-speed performance and, since Microsoft Word is not required on the Web server running WordWriter, your Web applications have licensing flexibility and ease of deployment.
