Picture

Description

A Picture object represents a picture in a worksheet and allows the size, position, and content of the picture to be managed. Once created, the data of a picture may not be changed or replaced with the data of another picture. Instead, delete the picture and create a new one.

C#

```
public sealed class Picture : Shape
```

vb.net

```
Public NotInheritable Class Picture
    Inherits Shape
```

Remarks

To create a `Picture` object, call Pictures.CreatePicture.

Properties

Name	Description
Height	Sets or returns the height of the Picture, in points (1/72 inch).
LockAspectRatio	Sets or returns whether the aspect ratio of the picture will be locked in Excel. This setting has no effect within ExcelWriter.
Name	Sets or returns the picture's name.
PictureData	Returns a new byte array containing the data of the picture as it would appear in an image file.
Position	Sets or returns the Picture's position in the worksheet. This property determines the location of the picture's upper left corner.
Shape	Returns the underlying Shape object for this Picture, allowing advanced formatting to be set.
Width	Sets or returns the width of the Picture, in points (1/72 inch).
