

# Area.ImportData(System.Data.DataView, DataImportProperties)

## Description

Imports data from an ADO.NET [DataView](#) to the specified [Area](#). The new data will overwrite values and formulas in the target worksheet cells, but existing formatting will be preserved.

### C#

```
public Area ImportData(System.Data.DataView data, DataImportProperties props)
```

### vb.net

```
Public Function ImportData(ByVal data As System.Data.DataView, ByVal props As DataImportProperties) As Area
```

## Parameters

### *data*

The [DataView](#) to import.

### *props*

A [DataImportProperties](#) object that contains a set of properties that will determine the behavior of the data import.

## Returns

An [Area](#) object representing the set of cells populated with the imported values.

## Examples

### C#

```
DataImportProperties importProps = wb.CreateDataImportProperties();  
importProps.Truncate = true;  
Area importedArea = a.ImportData(dv, importProps);
```

**vb.net**

```
Dim importProps As DataImportProperties = wb.CreateDataImportProperties()  
importProps.Truncate = True  
Dim importedArea As Area = a.ImportData(dv, importProps)
```
