

ColumnProperties.PaddingInChars

Description

Returns 'padding' (in characters) that needs to be added to the column width (in characters) to get true width of this column.

C#

```
public double PaddingInChars{ get; }
```

vb.net

```
Public ReadOnly Property PaddingInChars() As Double
```

Remarks

For example, let's say we have ten columns that are 3.71 characters wide. What is the width of a merged cell that spans all ten columns? To find the width in characters you have to include padding $10 * (\text{WidthInChar} + \text{PaddingInChars})$. For Arial 10 the padding is 0.71 and the width is 44.20
