

DataImportProperties.ConversionCulture

Description

Gets or sets the culture information to be used to convert the numeric strings such as currencies and formatted numerals in the imported data to numbers. By default it is set to `System.Globalization.CultureInfo.InvariantCulture`. This property setting will take effect only if the `ConvertStrings` property is set to `true`.

C#

```
public System.Globalization.CultureInfo ConversionCulture { get; set; }
```

vb.net

```
Public Property ConversionCulture() As System.Globalization.CultureInfo
```

Exceptions

ArgumentException

When the `ConversionCulture` property is set to `null` (C#) or `Nothing` (VB.NET), `ExcelWriter` will throw this exception.

Remarks

By default, when importing data, `ExcelWriter` will not convert numeric strings to numbers. If the `ConvertStrings` property is set to `true`, `ExcelWriter` will parse the strings into a `decimal` type by using the culture information specified through the `ConversionCulture` property. However if `ConvertStrings` is set to `false`, the setting of the `ConversionCulture` property will not take any effect and the numeric string will not be converted.

If `ConvertStrings` is enabled but no culture is set for the `ConversionCulture` property, then `ExcelWriter` will use the invariant culture, `System.Globalization.CultureInfo.InvariantCulture`, to parse the numeric strings.

Examples

C#

```
    DataImportProperties importProps = wb.CreateDataImportProperties();

    //--- Get ConversionCulture
    System.Globalization.CultureInfo conversionCulture =
importProps.ConversionCulture;

    //--- In order for the ConversionCulture setting to take effect, ConvertStrings
has to be enabled first
    importProps.ConvertStrings = true;

    //--- Example 1: Set ConversionCulture to the current thread's culture
    importProps.ConversionCulture =
System.Threading.Thread.CurrentThread.CurrentCulture;

    //--- Example 2: Set ConversionCulture specifically to the "en-US" culture
    importProps.ConversionCulture = new System.Globalization.CultureInfo("en-US");
```

vb.net

```
Dim importProps As DataImportProperties = wb.CreateDataImportProperties()

'--- Get ConversionCulture
Dim conversionCulture As System.Globalization.CultureInfo =
importProps.ConversionCulture

'--- In order for the ConversionCulture setting to take effect, ConvertStrings
has to be enabled first
importProps.ConvertStrings = True

'--- Example 1: Set ConversionCulture to the current thread's culture
importProps.ConversionCulture =
System.Threading.Thread.CurrentThread.CurrentCulture

'--- Example 2: Set ConversionCulture specifically to the "en-US" culture
importProps.ConversionCulture = New System.Globalization.CultureInfo("en-US")
```
