

# WordTemplate.Save(System.Web.HttpResponse)

## Description

If you pass [Save](#) an [HttpResponse](#) object object, WordWriter will stream the generated file to the client. If the user chooses to open (rather than save) the file, it will open in the browser window.

### C#

```
public void Save(System.Web.HttpResponse response)
```

### vb.net

```
Public Sub Save(ByVal response As System.Web.HttpResponse)
```

## Parameters

### *response*

The page's [HttpResponse](#) object.

## Exceptions

### *ArgumentNullException*

[Save](#) will throw this exception if `null` (C#) or `Nothing` (VB.NET) is passed to the method.

## Remarks

You can call [Save](#) more than once for a single instance of [WordTemplate](#). This allows you to save more than one copy of a generated file, and/or both save the file on the server and stream it to the client.

## Examples

### C#

```
...
WordTemplate oWW = new WordTemplate();
oWW.Open(Server.MapPath(@"./StringVarTemplate.doc"));
oWW.SetDataSource(MyDataTable);
oWW.Process();
oWW.Save(Page.Response);
```

```
...  
Dim oWW As New WordTemplate()  
oWW.Open(Server.MapPath("./StringVarTemplate.doc"))  
oWW.SetDataSource(MyDataTable)  
oWW.Process()  
oWW.Save(Page.Response)
```
