

SharePointIntegration.BindRowData(ExcelTemplate, Microsoft.SharePoint.SPList, String, DataBindingProperties)

Introduced in build 7.1.0.1855

Description

Sets a SharePoint List as a data source for a single row in a template.

C#

```
public static void BindRowData(this ExcelTemplate template,
    Microsoft.SharePoint.SPList list, String dataSourceName, DataBindingProperties
    properties)
```

vb.net

```
Public Shared Sub BindRowData(ByVal template As ExcelTemplate, ByVal list as
    Microsoft.SharePoint.SPList, ByVal dataSourceName As String, ByVal properties As
    DataBindingProperties)
```

Parameters

template

The current ExcelTemplate object which is calling BindRowData

list

SharePoint List to use as a data source for the template

dataSourceName

Name of the data source in the template

properties

The [DataBindingProperties](#) object which contains information about how the data should be bound to the template. `property` Must be specified, but the `DataBindingProperties` need not be set beforehand. To bind data to a template with the default `DataBindingProperties`, pass in `ExcelTemplate.CreateDataBindingProperties()` as the property value. Otherwise, use the `ExcelTemplate.CreateDataBindingProperties()` method to generate a new `DataBindingProperties` object and set the `DataBindingProperties.MaxRows`, `DataBindingProperties.Transpose`, and/or `DataBindingProperties.WorksheetName` properties for the workbook.

Exceptions

ArgumentNullException

`BindRowData` will throw this exception if `null` (C#) or `Nothing` (VB.NET) is passed to the method.

ArgumentException

Remarks

This is an extension method for the `ExcelTemplate` object to be used for binding SharePoint data to spreadsheets from within SharePoint. To use this method, you must add a reference to `SoftArtisans.OfficeWriter.ExcelWriter.SharePointIntegration.dll`
