

Workbook.GetNamedStyle(String)

Description

Returns a [NamedStyle](#) if it exists. If the style does not exist, null is returned.

C#

```
public NamedStyle GetNamedStyle(System.String styleName)
```

vb.net

```
Public Function GetNamedStyle(ByVal styleName As String) As NamedStyle
```

Parameters

styleName

The name of the style to retrieve.

Returns

The named style with the name *styleName*, or null if the style does not exist.

Examples

C#

```
NamedStyle heading1Style = wb.GetNamedStyle("Heading1");
```

vb.net

```
Dim heading1Style As NamedStyle = wb.GetNamedStyle("Heading1")
```
