

Area.ImportData(Object())()

Description

Imports data from a two-dimensional array of objects to the specified [Area](#) . The new data will overwrite values and formulas in the target worksheet cells, but existing formatting will be preserved.

C#

```
public Area ImportData(System.Object[][] data)
```

vb.net

```
Public Function ImportData(ByVal data As Object())() As Area
```

Parameters

data

A two-dimensional array of values to import to the worksheet. The first dimension corresponds to row and the second to column (that is, Object[row][column]).

Thus, an array of data { {"A","X"}, {"B","Y"}, {"C","Z"} } would be inserted into the worksheet as:

A	X
B	Y
C	Z

Returns

An [Area](#) object representing the set of cells populated with the imported values.

Examples

C#

```
Area data = a.ImportData(dataArray);
```

vb.net

```
Dim data As Area = a.ImportData(dataArray)
```
