

SourceField

Introduced in build 8.4

Description

The [SourceField](#) represents a source field in a PivotTable. To retrieve a SourceField use [PivotTable.SourceFields](#).

C#

```
public sealed class SourceField
```

vb.net

```
Public NotInheritable Class SourceField
```

Properties

Name	Description
Name	Returns the name of the SourceField.
Position	Returns the position of the SourceField in the SourceFields collection.

Remarks

A source field is a field that is automatically created based on the data source of the PivotTable and can be used to create data fields, row labels, column labels, and page fields. Each column of data in the PivotTable data source has a corresponding source field, and new source fields cannot be added.

Using the SourceField to create a [PivotTableField](#) will not change the SourceField.
