

Area.SetDataValidation(DataValidation)

Description

Assigns a data validation rule to all cells in the Area. If the [DataValidation](#) object uses a local reference or area in a formula (i.e. "=A5:B7"), then the area will adjust those local references accordingly based on the area's location. The original `DataValidation` object will not be affected.

C#

```
public void SetDataValidation(DataValidation dataValidation)
```

vb.net

```
Public Sub SetDataValidation(ByVal dataValidation As DataValidation)
```

Parameters

dataValidation

A [DataValidation](#) object representing the data validation rule to assign to the Area.

Examples

C#

```
area.SetDataValidation(myDataValidation);
```

vb.net

```
area.SetDataValidation(myDataValidation)
```
