

WordHyphenSettings

Description

This class is used to get and set Word hyphen settings for a document.

C#

```
<p> public sealed class WordHyphenSettings</p>
```

vb.net

```
<p>Public NotInheritable Class WordHyphenSettings</p>
```

Remarks

You cannot create a new `WordHyphenSettings` object. You must use the [Document.HyphenSettings](#) property to retrieve `WordHyphenSettings` properties for a document.

The following sample gets the `WordHyphenSettings` object of a document so you can start working with these properties.

Examples

C#

```
WordApplication app = new WordApplication();  
Document doc = app.Open(@"C:\sample.doc");  
WordHyphenSettings hyphenSettings = doc.HyphenSettings;
```

vb.net

```
Dim app As New WordApplication()  
Dim doc As Document = app.Open("C:\sample.doc")  
Dim hyphenSettings As WordHyphenSettings = doc.HyphenSettings
```

Properties

Name	Description
------	-------------

AllowedConsecutiveHyphens	Sets or returns an <code>int</code> that represents the number of consecutive lines that can be auto-hyphenated by Word in this document.
AutoHyphen	Sets or returns a <code>boolean</code> that represents whether or not Word will automatically hyphenate this document.
CapitalHyphenation	Sets or returns a <code>boolean</code> that represents whether or not Word is allowed to hyphenate words that are capitalized in this document.
HyphenationWidth	Sets or returns an <code>int</code> that represents the hyphenation width in twips for this document. The hyphenation width is the amount of space to leave between the end of the last word in a line and the right margin. To reduce the number of hyphens, make the hyphenation zone wider. To reduce the raggedness of the right margin, make the hyphenation zone narrower. One twip = (1/20 pt) or (1/1440 in).
