

WordTemplate.Save

Overload	Description
<code>Save(String)</code>	Saves the generated Word file on the server.
<code>Save(System.IO.Stream)</code>	Sends the generated Word binary file to the specified <code>System.IO.Stream</code> or, a class derived from <code>System.IO.Stream</code> (for example, <code>System.IO.FileStream</code>).
<code>Save(System.Web.HttpResponse)</code>	If you pass <code>Save</code> an <code>HttpResponse</code> object object, <code>WordWriter</code> will stream the generated file to the client. If the user chooses to open (rather than save) the file, it will open in the browser window.
<code>Save(System.Web.HttpResponse, String, Boolean)</code>	If you pass <code>save</code> an <code>HttpServletResponse</code> object, <code>WordWriter</code> will stream the generated file to the client. This method allows you to specify a default client-side file name, and whether the file should be opened in the browser window or in Microsoft Word.

SharePoint Integration Extension Methods

Introduced in build 4.5

Overload	Description
<code>Save(Microsoft.SharePoint.SPDocumentLibrary, String, Boolean)</code>	Saves the generated Word file to a SharePoint Document Library.
<code>Save(Microsoft.SharePoint.SPListItem, String)</code>	Saves the generated Word file to a SharePoint List Item.
