

PowerPointTemplate.Save(System.Web.HttpResponse, String, Boolean)

Description

Streams the PowerPointTemplate to the client. This method allows you to specify a default client-side file name, and whether the file should be opened in the browser window or in Microsoft PowerPoint.

C#

```
Public void Save(System.Web.HttpResponse response, System.String attachmentName,
boolean openInBrowser)
```

vb.net

```
Public Sub Save(ByRef response As System.Web.HttpResponse, ByVal attachmentName As
String, ByVal openInBrowser As Boolean)
```

Parameters

response

An HttpResponse to write the resulting PowerPoint file to.

attachmentName

Specifies a name for the generated Excel file; this name will be displayed in the download dialog when the file is streamed to the browser.

openInBrowser

If *openInBrowser* is set to *true*, and the user chooses to open the file, the file will open in the browser window.

Examples

Stream to the client and open in PowerPoint

When you pass an HttpResponse object to *Save*, PowerPointWriter will stream the generated PowerPoint file to the client. The browser will display a File Download dialog asking the user to open or save the file. The method's second parameter specifies a file name to display in the File Download dialog. If the method's third parameter *openInBrowser* is *false* and the user chooses to open the Excel file, the file will open in Microsoft PowerPoint.

C#

```
//--- Stream to the client
//--- "Output.pptx" will appear in the Save As dialog
//--- The file will open in PowerPoint
pptTemplate.Save(Page.Response, "Output.pptx", false);
```

vb.net

```
'--- Stream to the client
'--- "Output.pptx" will appear in the Save As dialog
'--- The file will open in PowerPoint
pptTemplate.Save(Page.Response, "Output.pptx", False)
```

Stream to the client and open in the browser window

When you pass an `HttpResponse` object to `Save`, `PowerPointWriter` will stream the generated PowerPoint file to the client. The browser will display a File Download dialog asking the user to open or save the file. The method's second parameter specifies a file name to display in the File Download dialog. If the method's third parameter - `openInBrowser` - is `True` and the user chooses to open the PowerPoint file, the file will open in the browser window.

C#

```
//--- Stream to the client
//--- "Output.pptx" will appear in the Save As dialog
//--- The file will open in the browser's Excel 2007 plug-in
pptTemplate.Save(Page.Response, "Output.pptx", true);
```

vb.net

```
'--- Stream to the client
'--- "Output.pptx" will appear in the Save As dialog
'--- The file will open in the browser's PowerPoint plug-in
pptTemplate.Save(Page.Response, "Output.pptx", True)
```
