WordApplication.Save(Document, String)

Description

Writes a Document to a file.

C#

```
public void Save(Document doc, System.String fileName)
```

vb.net

```
Public Sub Save(ByVal doc As Document, ByVal fileName As String)
```

Parameters

doc

The `Document` to save.

fileName

The full filename to save the `Document` to.

Exceptions

System.Exception

Thrown if there is an error saving the file.

Remarks

The WordApplication.Preserve property is used to specify the way WordWriter will save the document. When the `preserve` property is set to true, WordWriter attempts to preserve all formatting and features that it doesn't directly support. This includes Fields, Footnotes, Hyperlinks, Comments, and Anchored Images. When the `preserve` property is false, only those features directly supported by WordWriter will be preserved. This includes all Tables, Lists, Headers and Footers.

Examples

C#

```
        app.Preserve = true;
        app.Save(doc, "@C:\sample.doc");
```

```vb.net
app.Preserve = True
app.Save(doc, "C:\sample.doc")
```
