

ColumnProperties.ApplyStyle(Style)

Description

Applies a style to the column. When a style is applied - rather than set (see [ColumnProperties.Style](#)) - only the differences between the new style and style properties previously assigned to the column (through the ExcelWriter API or in Microsoft Excel) will take effect. For example, if a cell in the column has a background color and the new style applied does not contain a background color, the cell's color will not be affected.

C#

```
public void ApplyStyle(Style style)
```

vb.net

```
Public Sub ApplyStyle(ByVal style As Style)
```

Parameters

style

The [Style](#) object to apply to the row.

Examples

C#

```
colProps.ApplyStyle(styl);
```

vb.net

```
colProps.ApplyStyle(styl)
```
