

Range.ApplyStyle(Style)

Description

Applies a style to the area. When a style is applied - rather than set (see [Range.SetStyle](#)) - only the differences between the new style and style properties previously assigned to the range (through the ExcelWriter API) will take effect. For example, if the range has a background color and the new style applied does not contain a background color, the area's color will not be affected.

C#

```
public void ApplyStyle(Style style)
```

vb.net

```
Public Sub ApplyStyle(ByVal style As Style)
```

Parameters

style

A [Style](#) object representing the style to apply to the cell.
