

ShowValueAs.ValueType

Introduced in build 8.4

Description

Returns the type of calculation used to determine the displayed value of a data field. The available types are determined by [ShowValueAs.ShowValueAsType](#).

C#

```
public ShowValueAsType ValueType{ get; }
```

vb.net

```
Public Property ValueType() As ShowValueAsType
```

Remarks

Value fields always return `ShowValueAsType.Normal`. You can check if a Pivot Table field is a value field with the `IsValuesLabel` Property

This is set using [SetShowValueAs\(\)](#).

When calling `SetShowValueAs()`, certain `ShowValueAsTypes` use a source field as a base field and an index for one of the values in the data source column associated with the source field.
