

# WordApplication.Save(Document, String)

## Description

Writes a [Document](#) to a file.

### C#

```
public void Save(Document doc, System.String fileName)
```

### vb.net

```
Public Sub Save(ByVal doc As Document, ByVal fileName As String)
```

## Parameters

### *doc*

The [Document](#) to save.

### *fileName*

The full filename to save the [Document](#) to.

## Exceptions

### *System.Exception*

Thrown if there is an error saving the file.

## Remarks

The [WordApplication.Preserve](#) property is used to specify the way [WordWriter](#) will save the document. When the `preserve` property is set to true, [WordWriter](#) attempts to preserve all formatting and features that it doesn't directly support. This includes Fields, Footnotes, Hyperlinks, Comments, and Anchored Images. When the `preserve` property is false, only those features directly supported by [WordWriter](#) will be preserved. This includes all Tables, Lists, Headers and Footers.

## Examples

### C#

```
app.Preserve = true;  
app.Save(doc, @"C:\sample.doc");
```

**vb.net**

```
app.Preserve = True  
app.Save(doc, "C:\sample.doc")
```
