

WordApplication.Save(Document, System.IO.Stream)

Description

Writes a [Document](#) to a stream in the form of a Microsoft Word document.

C#

```
public void Save(Document doc, System.IO.Stream @out)
```

vb.net

```
Public Sub Save(ByVal doc As Document, ByVal out As System.IO.Stream)
```

Parameters

doc

The [Document](#) to save.

out

The [Stream](#) to write the file to.

Exceptions

System.Exception

Thrown if there is a problem saving the file.

Remarks

The [WordApplication.Preserve](#) property is used to specify the way [WordWriter](#) will save the document. When the `preserve` property is set to true, [WordWriter](#) attempts to preserve all formatting and features that it doesn't directly support. This includes Fields, Footnotes, Hyperlinks, Comments, and Anchored Images. When the `preserve` property is false, only those features directly supported by [WordWriter](#) will be preserved. This includes all Tables, Lists, Headers and Footers.

Examples

C#

```
app.Save(doc, strm);
```

vb.net

```
app.Save(doc, strm)
```
