PowerPointApplication.Save(PowerPointWriter.Presentation, System.Web.HttpResponse, String, Boolean, String)

Description

Streams the specified presentation to the client. It should be the only method that uses the response object, as it automatically sets response headers, clears the body of the response, and flushes it to the client.

C#

```csharp
public virtual void Save(Presentation presentation, System.Web.HttpResponse
response,String attachmentName,  boolean openInBrowser, String contentType)
```

---

vb.net

```vbnet
Public Overridable Sub Save(ByVal presentation As Presentation, ByVal response As
System.Web.HttpResponse, ByVal attachmentName As String, ByVal openInBrowser As
Boolean, ByVal contentType As String)
```

Parameters

presentation

A Presentation object representing the presentation to save.

response

A `System.Http.Response` object, usually Page.Response.

attachmentName

Specifies a name for the presentation. This name will be displayed in the download dialog when the file is streamed to the browser.

openInBrowser

If true, the spreadsheet will be opened in place in Internet Explorer, rather than spawning a separate PowerPoint window.

contentType

The content-type header sent to the browser with the generated spreadsheet

Examples

C#

```csharp
PowerPointApplication pptApp = new PowerPointApplication();
Presentation pres = pptApp.Create(PowerPointApplication.FileFormat.Pptx);

//--- Do something here
pptApp.Save(pres, Page.Response, "generated.pptx", false, "application/unknown");
```

vb.net

```vbnet
Dim pptApp As New PowerPointApplication()
Dim pres As Presentation = pptApp.Create(PowerPointApplication.FileFormat.Pptx)

'--- Do something here
pptApp.Save(pres, Page.Response, "generated.pptx", False, "application/unknown")
```
