

# AutoFormatter.FormatCell(TableCell, Int32, Int32, AutoFormatter.Edge)

## Description

This method must be implemented by the class you want to use as an AutoFormatter. Then, when you import data, you can use `DataImportProperties.AutoFormatter` to set the AutoFormatter for that data import.

### C#

```
public abstract void FormatCell(TableCell aCell, int aRow, int aColumn, Edge  
aLocation)
```

### vb.net

```
Public MustOverride Sub FormatCell(ByVal aCell As TableCell, ByVal aRow As Integer,  
ByVal aColumn As Integer, ByVal aLocation As Edge)
```

## Parameters

### *aCell*

The table cell to format.

### *aRow*

The 0-based row index of the cell to format.

### *aColumn*

The 0-based column index of the cell to format.

### *aLocation*

The location of the cell in relation to the outer edge of the table.
