# Position.InsertText(String, Boolean)

## **Description**

Creates and returns a CharacterRun at the point represented by this Position. The text to be inserted is specified as well as whether this should be a new character run or part of the previous one.

C#

public CharacterRun InsertText(System.String text, boolean newRun)

#### vb.net

Public Function InsertText(ByVal text As String, ByVal newRun As Boolean) As CharacterRun

### **Parameters**

#### text

A String representing the text to insert.

#### newRun

A boolean representing if this should have default formatting and become its own character run (true) or if it should assume the formatting of the first character in this element, becoming a part of that first character run.

### Returns

The CharacterRun containing the inserted text.

# **Examples**

C#

CharacterRun charRun = pos.InsertText("Here is some text.", true);

vb.net

Dim charRun As CharacterRun = pos.InsertText("Here is some text.", True)
