

Element.ImportData(Object(), String(), DataImportProperties)

Description

Imports the data from a rectangular array into a [Table](#) at the point of the current element in the document. Also accepts an array of column names and a [DataImportProperties](#) object with the import options.

C#

```
public Table ImportData(System.Object[,] data, System.String[] columnNames,  
DataImportProperties props)
```

vb.net

```
Public Function ImportData(ByVal data As Object(), ByVal columnNames As String(),  
ByVal props As DataImportProperties) As Table
```

Parameters

data

The rectangular array to import the data from.

columnNames

Array of column names, corresponding to columns of data in the rectangular array.

props

Import properties for this data import, including max rows, max columns, column filter, etc.

Returns

The [Table](#) that the data was imported into.

Examples

C#

```
Table tbl = e.ImportData(rectArray, colArray, importProps);
```

vb.net

```
Dim tbl As Table = e.ImportData(rectArray, colArray, importProps)
```
