

Chart.MoveChart(Chart.ChartLocation, Int32)

Description

Moves the chart to a different worksheet. The method specifies whether the chart should be inserted as an object within the worksheet, or converted to a chart sheet.

C#

```
public void MoveChart(ChartLocation chartLocation, int sheetIndex)
```

vb.net

```
Public Sub MoveChart(ByVal chartLocation As ChartLocation, ByVal sheetIndex As Integer)
```

Parameters

chartLocation

Chart.ChartLocation.ChartAsSheet or Chart.ChartLocation.ObjectInSheet.

sheetIndex

The 0-based index of the worksheet to move the chart to or the index of the chartsheet to insert.

Exceptions

IndexOutOfRangeException

An IndexOutOfRangeException will be thrown if *sheetIndex* is less than 0 or greater than the total number of worksheets.

ArgumentException

An ArgumentException will be thrown if *chartLocation* is ObjectInSheet but the sheet at index *sheetIndex* is actually a Chartsheet.

Remarks

If *chartLocation* is ChartAsSheet, this method will create a new Chartsheet at *sheetIndex* that contains the chart.

If *chartLocation* is ObjectInSheet, this method will move the chart into the worksheet at *sheetIndex*, maintaining the original chart position.

In either case, the chart's formulas (for series data, axis titles, etc) will maintain their original references.

If the chart is inside a chartsheet before calling this method, that chartsheet is deleted.
