

Position.InsertText(String, Boolean)

Description

Creates and returns a [CharacterRun](#) at the point represented by this [Position](#). The text to be inserted is specified as well as whether this should be a new character run or part of the previous one.

C#

```
public CharacterRun InsertText(System.String text, boolean newRun)
```

vb.net

```
Public Function InsertText(ByVal text As String, ByVal newRun As Boolean) As  
CharacterRun
```

Parameters

text

A [String](#) representing the text to insert.

newRun

A [boolean](#) representing if this should have default formatting and become its own character run (true) or if it should assume the formatting of the first character in this element, becoming a part of that first character run.

Returns

The [CharacterRun](#) containing the inserted text.

Examples

C#

```
CharacterRun charRun = pos.InsertText("Here is some text.", true);
```

vb.net

```
Dim charRun As CharacterRun = pos.InsertText("Here is some text.", True)
```
