

Worksheet.GetNamedRange(String)

Description

Returns the named [Range](#) object that specified by name. If the named range does not exist, the method returns null.

C#

```
public Range GetNamedRange(System.String name)
```

vb.net

```
Public Function GetNamedRange(ByVal name As String) As Range
```

Parameters

name

The name of the range.

Returns

A named [Range](#) object, or null if the range does not exist.

Examples

C#

```
Range named = ws.GetNamedRange("MyNamedRange");
```

vb.net

```
Dim named As Range = ws.GetNamedRange("MyNamedRange")
```
