ChartRegion.Font

Description

Sets or returns the font for text in the chart region.
(ChartRegions obtained from Chart.PlotArea don't support fonts.)

C#

```
public Font Font{ get; set; }
```

vb.net

```
Public Property Font() As Font
```

Remarks

If the ChartRegion object represents the chart area, the font returned will be the font for the entire chart. Setting a property on this font will cause all other fonts in the chart to have the same font as the chart area.

If the `ChartRegion` represents a legend, the font returned will be the font for all items in the legend. Setting a property on this font will also set this property for all other fonts inside the legend.

If the `ChartRegion` represents a series label, the font returned will be the font for all data labels in the series. Setting a property on this font will also set this property for all data point labels of this series.

There is no font for the plot area.
