

Groups.ListGroups()

Description

Returns an array of all the [Group](#) objects in the collection.

C#

```
public Group[] ListGroups()
```

vb.net

```
Public Function ListGroups() As Group()
```

Returns

An array of all the [Group](#) objects in the collection.

Remarks

Note that the array returned by `ListGroups` is a copy of the internal structure that `ExcelWriter` uses to manage `Groups`. As such, operations on individual `Group` objects in the array will take effect in the workbook, but operations on the array (e.g., removing `Group` objects or changing their order) will not have any effect.
