CellStyle

Description

The unique cell style for a given cell.

C#

```
public sealed class CellStyle : Style
```

vb.net

```
Public NotInheritable Class CellStyle
   Inherits Style
```

Remarks

Every cell in an Excel workbook contains a unique cell style. This style is exposed by ExcelWriter through the CellStyle class. Changes to a `Cell Style` affect only the cell that owns the style. A `CellStyle` may be "set" on another cell or group of cells, but this action clones the style. Changes to the original `CellStyle` reference affect only the owning cell and changes to the cloned `CellStyle` affect only the cell on which the style was set. If the style is "set" on a cell grouping object, such as an area, range, row, or column, each cell in the grouping receives a unique clone of the style.
