

Area.ImportData(Object(,))

Description

Imports data from a rectangular array of objects to the specified [Area](#). The new data will overwrite values and formulas in the target worksheet cells, but existing formatting will be preserved.

C#

```
public Area ImportData(System.Object[,] data)
```

vb.net

```
Public Function ImportData(ByVal data As Object(,)) As Area
```

Parameters

data

A rectangular array of values to import to the worksheet. The first dimension corresponds to row and the second to column. Thus, an array of data { {"A","X"}, {"B","Y"}, {"C","Z"} } would be inserted into the worksheet as:

| | |
|---|---|
| A | X |
| B | Y |
| C | Z |

Returns

An [Area](#) object representing the set of cells populated with the imported values.

Examples

C#

```
Area importedArea = a.ImportData(dataArray);
```

vb.net

```
Dim importedArea As Area = a.ImportData(dataArray)
```
