

# Element.ImportData(Object(,), String(), DataImportProperties)

## Description

Imports the data from a rectangular array into a [Table](#) at the point of the current element in the document. Also accepts an array of column names and a [DataImportProperties](#) object with the import options.

### C#

```
public Table ImportData(System.Object[,] data, System.String[] columnNames,
DataImportProperties props)
```

### vb.net

```
Public Function ImportData(ByVal data As Object(,), ByVal columnNames As String(),
ByVal props As DataImportProperties) As Table
```

## Parameters

### *data*

The rectangular array to import the data from.

### *columnNames*

Array of column names, corresponding to columns of data in the rectangular array.

### *props*

Import properties for this data import, including max rows, max columns, column filter, etc.

## Returns

The [Table](#) that the data was imported into.

## Examples

### C#

```
Table tbl = e.ImportData(rectArray, colArray, importProps);
```

**vb.net**

```
Dim tbl As Table = e.ImportData(rectArray, colArray, importProps)
```
