PowerPointTemplate.Save(System.Web.HttpResponse)

Description

Streams the PowerPointTemplate to the client.

C#

```csharp
public void Save(System.Web.HttpResponse response)
```

---

vb.net

```vbnet
Public Sub Save(ByRef response As System.Web.HttpResponse)
```

Parameters

response

An HttpResponse to write the resulting PowerPoint file to.

Exceptions

InvalidOperationException

`Save` will throw this exception if it does not have a PowerPoint document handle (`Save` cannot be called before `Open`).

Remarks

If the user chooses to open rather than save the file, it will open in the browser window. PowerPointWriter will set a default name for the file. To set a different file name and/or open the file in Microsoft PowerPoint, use the signature Save(HttpResponse,String,Bool)

You can call `Save` more than once for a single instance of PowerPointTemplate. This allows you to save more than one copy of a generated file, and/or both save the file on the server and stream it to the client.

Examples

C#

```csharp
using (PowerPointTemplate ppt = new PowerPointTemplate())
{
 ppt.Open("MyInputFilePath.pptx");

 // where response is the HttpResponse for the current page
 ppt.Save(response);
}
```
