Workbook.CreateStyle()

Description

Creates a global style, which can be bound to cells, areas, ranges, rows, and columns. Any later changes to this style will affect all cells to which the style was bound.

C#

```
public GlobalStyle CreateStyle()
```

vb.net

```
Public Function CreateStyle() As GlobalStyle
```

Returns

A GlobalStyle object which can be linked and applied to cells, but will not be accessible from the generated Excel spreadsheet.

Remarks

To bind a style to a cell or set of cells, use either Style or `ApplyStyle`. Both are accessible through the following objects: Cell, Area, Range, RowProperties, and ColumnProperties.

Examples

C#

```
Style styl = wb.CreateStyle();
```

vb.net

```
Dim styl As Style = wb.CreateStyle()
```
