

Workbook.CreateConditionalFormat()

Description

Creates a new [ConditionalFormat](#) object that can be set on [Cells](#), [Areas](#) and [Ranges](#).

C#

```
public ConditionalFormat CreateConditionalFormat()
```

vb.net

```
Public Function CreateConditionalFormat() As ConditionalFormat
```

Returns

A [ConditionalFormat](#) object representing a conditional format that Excel will apply to a cell or group of cells if a specified condition is met.

Remarks

A [Cell](#), [Area](#) or [Range](#) object holds its own copy of the [ConditionalFormat](#) when set; changes made to a [ConditionalFormat](#) after it is set will not affect the copies.

Examples

C#

```
wb.CreateConditionalFormat();
```

vb.net

```
wb.CreateConditionalFormat()
```
