ExcelTemplate.Save(System.Web.HttpResponse, String, Boolean)

Description

If you pass Save an HttpResponse object, ExcelWriter will stream the generated file to the client. This method allows you to specify a default client-side file name, and whether the file should be opened in the browser window or in Microsoft Excel.

-	void Save(System.Web.HttpResponse response, System.String boolean openInBrowser)	
vb.net		

Parameters

response

A System. Http. Response object, usually Page. Response

attachmentName

Specifies a name for the generated Excel file; this name will be displayed in the download dialog when the file is streamed to the browser.

openInBrowser

If openInBrowser is set to true, and the user chooses to open the file, the file will open in the browser window. If openInBrowser is set to fa lse, and the user chooses to open the file, the file will open in Microsoft Excel. By default, the file will open in the browser window.

Remarks

ExcelWriter allows you to save in both the Excel 97-03 BIFF8 format (.xls) or the new Office Open XML (.xlsx) format. The template file must be of the expected output format. Hence, if you wish to output .xls files, you must start with a .xls template, and if you wish to output .xlsx files, you must start with a .xlsx template. ExcelWriter does not support the creation or editing of .xlsx files with the ExcelApplication object.

You can call Save more than once for a single instance of ExcelTemplate. This allows you to save more than one copy of a generated file, and/or both save the file on the server and stream it to the client.

Examples

Stream to the client and open in Excel

When you pass an HttpResponse object to Save, ExcelWriter will stream the generated Excel file to the client. The browser will display a File Download dialog asking the user to open or save the file. The method's second parameter specifies a file name to display in the File Download

dialog. If the method's third parameter - openInBrowser - is false and the user chooses to open the Excel file, the file will open in Microsoft Excel.

```
C#
//--- Stream to the client
//--- "Output.xls" will appear in the Save As dialog
//--- The file will open in Excel
xlTemplate.Save(Page.Response, "Output.xls", false);
//--- Stream to the client
//--- "Output.xlsx" will appear in the Save As dialog
//--- The file will open in Excel 2007 only
xlTemplate.Save(Page.Response, "Output.xlsx", false);
```

vb.net

'--- Stream to the client
'--- "Output.xls" will appear in the Save As dialog
'--- The file will open in Excel
xlTemplate.Save(Page.Response, "Output.xls", False)
'--- Stream to the client
'--- "Output.xlsx" will appear in the Save As dialog
'--- The file will open in Excel 2007 only
xlTemplate.Save(Page.Response, "Output.xlsx", False)

Stream to the client and open in the browser window

When you pass an HttpResponse object to Save, ExcelWriter will stream the generated Excel file to the client. The browser will display a File Download dialog asking the user to open or save the file. The method's second parameter specifies a file name to display in the File Download dialog. If the method's third parameter - openInBrowser - is True and the user chooses to open the Excel file, the file will open in the browser window.

```
C#
    //--- Stream to the client
    //--- "Output.xls" will appear in the Save As dialog
    //--- The file will open in the browser's Excel plug-in
    xlTemplate.Save(Page.Response, "Output.xls", true);
    ...
    //--- Stream to the client
    //--- "Output.xlsx" will appear in the Save As dialog
    //--- The file will open in the browser's Excel 2007 plug-in
    xlTemplate.Save(Page.Response, "Output.xlsx", true);
```

```
'--- Stream to the client
'--- "Output.xls" will appear in the Save As dialog
'--- The file will open in the browser's Excel plug-in
xlTemplate.Save(Page.Response, "Output.xls", True)
...
'--- Stream to the client
'--- "Output.xlsx" will appear in the Save As dialog
'--- The file will open in the browser's Excel 2007 plug-in
xlTemplate.Save(Page.Response, "Output.xlsx", True)
```
