

Series.NameFormula

Description

Sets or returns the formula containing the name of the series. See also [Series.Name](#).

C#

```
public System.String NameFormula{ get; set; }
```

vb.net

```
Public Property NameFormula() As String
```

Remarks

If neither a Name nor a NameFormula are set, a default series name will be used in the worksheet. The default name is the series number.

Setting this property will clear the [Series.Name](#) property. If you set both a Name and a NameFormula, the one that is set last will take effect.
