

Trendline.Name

Description

Sets or returns the name of the trendline.

C#

```
public System.String Name{ get; set; }
```

vb.net

```
Public Property Name() As String
```

Remarks

Trendlines have a default name that Excel uses. This name is based on the [RegressionType](#), [RegressionValue](#) and [series name](#). Explicitly setting this property will override the default name. Setting this property to null or an empty string will make the trendline use Excel's default name instead of a custom name.
