

Element.GetPosition(Int32)

Description

Returns a [Position](#) object that represents the location specified by the offset. The Position object can be used similar to a cursor.

C#

```
public virtual Position GetPosition(int offset)
```

vb.net

```
Public Overridable Function GetPosition(ByVal offset As Integer) As Position
```

Parameters

offset

An `int` representing the relative offset from the start of this `Element` to get the `Position` for.

Returns

A `Position` object that represents the location specified by the offset.

Examples

C#

```
Position oPosition = e.GetPosition();
```

vb.net

```
Dim oPosition As Position = e.GetPosition()
```
