

# DocumentProperties.GetProperty(String)

## Description

Returns an `Object` that represents the value of the property specified.

### C#

```
public System.Object GetProperty(System.String propertyName)
```

### vb.net

```
Public Function GetProperty(ByVal propertyName As String) As Object
```

## Parameters

### *propertyName*

A `String` representing the name of the property to retrieve.

## Returns

An `Object` that represents the value of the property specified.

## Remarks

MS Word equivalent: File menu > Properties > Custom tab > Properties:

## Examples

### C#

```
//--- Return "Priority" Property  
string priority = docProps.GetProperty("Priority");
```

### vb.net

```
'--- Return "Priority" Property  
Dim priority As String = docProps.GetProperty("Priority")
```
