

Worksheet.CreateAreaOfRows(Int32, Int32)

Obsolete

This method has been deprecated, as it is not the most efficient way to edit Row properties. Instead, use the [Worksheet.GetRowProperties\(Int32\)](#) method to return the [RowProperties](#) object of the desired row.

Description

Returns an [Area](#) object representing all the cells in a specified group of rows. An area is a rectangular collection of cells.

C#

```
public Area CreateAreaOfRows(int firstRow, int numRows)
```

vb.net

```
Public Function CreateAreaOfRows(ByVal firstRow As Integer, ByVal numRows As Integer)  
As Area
```

Parameters

firstRow

The 0-based index of the first row.

numRows

The number of rows to include.

Returns

An [Area](#) object representing the set of cells in the specified rows.

Examples

C#

```
Area a = ws.CreateAreaOfRows(0, 25);
```

vb.net

```
Dim a As Area = ws.CreateAreaOfRows(0, 25)
```
