

DataPoint.LegendEntryFont

Description

Sets or returns the [Font](#) for this [DataPoint](#)'s legend entry.

C#

```
public Font LegendEntryFont{ get; set; }
```

vb.net

```
Public Property LegendEntryFont() As Font
```

Remarks

These legend entries are only visible in certain cases:

- If a chart has any trendlines, they are **not** visible
- If a chart is a pie or doughnut chart, and it has only one [Series](#) or only one set of related series, they **are** visible
- If a chart has only one series and [Series.VaryColorsByPoint](#) is set to true, and it's a type of chart which supports VaryColorsByPoint, they **are** visible. (Supported charts are all charts which are not [Area](#) charts, [Surface](#) charts, or [filled-in radar](#) charts.)

In all other cases these are **not** visible.

When data point legend entry fonts are not visible, [series legend entries](#) and [trendline entries](#) are shown instead.
